## About GreenClassify

GreenClassify is an innovative AI-powered web application designed to accurately classify different types of vegetables based on their images.

Using advanced Convolutional Neural Networks (CNNs), our system analyzes the features of uploaded vegetable images and instantly identifies the vegetable. This technology can be helpful for farmers, vendors, educators, and food industry professionals who require quick and accurate vegetable recognition.

### Key Features:

- **Real-time Classification:** Upload an image and get immediate results.
- **Deep Learning Accuracy:** Powered by deep learning algorithms trained on a diverse vegetable dataset.
- **User-Friendly Interface:** Simple and intuitive design for users of all backgrounds.
- **High-Speed Performance:** Fast image processing for an instant user experience.

### How It Works:

1. The user uploads a vegetable image using the 'Vegetable Classification' page.
2. The backend processes the image using a trained AI model.
3. The model identifies the vegetable and returns the prediction to the user.

Our mission is to blend artificial intelligence with agriculture to improve productivity, reduce manual errors, and promote smart farming solutions.
